

## Foundation failure

A variety of soil composites prevalent throughout the United States are responsible for the majority of foundation and support structure damage in a home or other building. Clay and limestone expand and contract due to fluctuations in moisture and temperature; sandy soils shift and erode; fill dirt used on construction sites may not compact properly. Virtually all building surfaces present the chance for foundation failure, bringing a unique set of issues to the homebuyer, seller or builder.

Only a full service company like K.C. WATERPROOFING and RAM JACK FOUNDATION REPAIR SYSTEMS provides the customer with the complete range of solutions necessary to prevent or repair the various problems occurring in this region.

Our skilled staff is trained to recognize the complete spectrum of potential problems, and then offer the most appropriate, cost-effective and timely option.

## Some common signs of foundation distress

### Inside The House

- Misaligned doors and windows
- Doors and windows that stick or won't stay shut
- Cracks in the sheetrock
- Sloping of the floor

### Outside The House

- Cracks in the brick
- Gaps around the doors and windows
- Cracks in the foundation
- Fascia board pulling away

### In The Garage

- Separation from door
- Walls rotating out
- Cracked brick or sheetrock

### In The Basement

- Walls bulging, leaning in or out
- Cracks in the wall
- Leaks, dampness or water intrusion
